

BREMELANOTIDE PT-141

PATIENT EDUCATION SHEET

WHAT IS BREMELANOTIDE PT-141?

Bremelanotide PT-141 was developed from the peptide hormone Melanotan II for aphrodisiac effects.

Bremelanotide PT-141 effects sexual function via interaction with the hypothalamus. Its usage has been found to induce the rapid onset of arousal. This peptide has been found to increase erection in 80% of males who did not respond to Viagra or Cialis. Bremelanotide PT-141 has all shown an ability to increase the chances of women achieving at least one sexually gratifying experience by up to 50%.

BREMELANOTIDE PT-141

PATIENT EDUCATION SHEET

What forms of Bremelanotide PT-141 are available?

Bremelanotide PT-141 is available for subcutaneous injection.

How does Bremelanotide PT-141 work?

Unlike other sexual-enhancement drugs, Bremelanotide PT-141 acts at the level of the brain, thus eliciting a rather natural sexual response. Melanotan II (MT II) is a peptide hormone that acts to increase sexual arousal by interacting with the hypothalamus in the brain. As a derivative of MT II, Bremelanotide PT-141 induces sexual arousal by binding to melanocortin receptors in the hypothalamus.

Why would I want to use Bremelanotide PT-141?

Bremelanotide PT-141 has been shown to:

- Produce rapid onset of sexual arousal
- Heightens libido
- Improve symptoms of female sexual dysfunction
- Induces erection in men suffering from ED
- Improves sexual dysfunction on level of central nervous system

What You Need To Know

Reported side effects of Bremelanotide PT-141 are flushing, nausea and gastrointestinal upset. No contraindications have been reported.
